

Japan's New Emissions Reduction Target for 2020

New Target:
3.8% reduction compared to 2005 level

This target has been formulated as:

- a target at this point
- determined without taking into account the emissions reduction effect by nuclear power, given that the energy policy and energy mix is still under consideration.

Japan will come up with a firm target based on further review in line with the progress of consideration of the energy policy and energy mix.
